INDICATOR GUIDE

# HTF Levels

Map the liquidity that matters. HTF Levels marks the **high and low of previous Daily, Weekly and Monthly periods** — the resting liquidity price reaches for — and shows you the moment each level gets swept.

## The idea: higher-timeframe liquidity

Old highs and lows are where stop orders pile up. Price is drawn toward that resting liquidity, takes it (a **sweep**), and often reverses. HTF Levels keeps those levels — and their 50% equilibrium — in front of you, and fades them once they're taken.

### Resting liquidity
*The draw*

Previous highs & lows are where stops sit. They pull price like magnets.

### The sweep
*The grab*

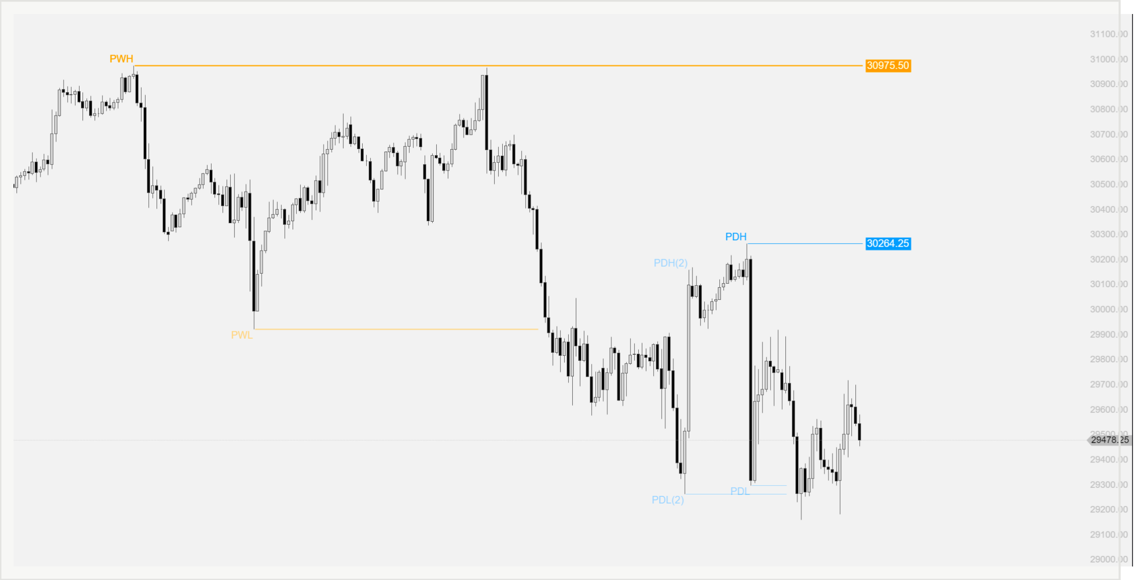
Price trades one tick past the level = swept. It dims or hides — the grab is done.

### Equilibrium
*The 50%*

The midline splits premium from discount — a clean reference inside the range.

## What it draws on your chart

| | |
|---|---|
| **Previous level lines** | High & low of each previous period — labelled PDH/PDL, PWH/PWL, PMH/PML and colour-coded per timeframe. Show as many previous periods as you like. |
| **Current (developing)** | Optional: the live period's running high/low. Off by default — turn it on per timeframe. |
| **Sweep handling** | When a level is taken, it dims (adjustable brightness) or hides, and the line freezes near the sweep — so the chart shows mostly resting, untaken liquidity. |
| **Midline (equilibrium)** | Optional 50% line per timeframe, with its own previous count so you can show many levels but just one or two equilibriums. |
| **Price tags** | The exact price in a colour tag at the line end — placed out to the right so it never covers where price is approaching the level. |
| **Smart labels** | When several levels cluster, labels stack instead of overlapping (see below). |
| **History warning** | If the chart hasn't loaded enough bars for the periods you asked for, an on-chart notice tells you to add history. |



*HTF Levels on a chart — previous day / week / month highs & lows, with smart labels that stack cleanly.*

# Settings overview

Everything is optional and colour-adjustable. Here's what each group controls.

| General | What it does |
|---|---|
| **Unswept lines reach** | Run unswept lines to the current bar or all the way to the price axis. |
| **Sweep stop offset (bars)** | Where a swept line freezes, relative to the bar that swept it. |
| **Dim swept / Swept brightness** | Fade taken levels, and how faint they go. |
| **Hide swept levels** | Remove taken levels entirely — show only resting liquidity. |
| **Show labels / position / font** | Toggle the level labels, put them at the line start or end, set size. |
| **Show price tags / unswept only / colour** | Show the exact price tag, optionally only on untaken levels. |
| **Max scan bars** | Safety cap on history scanned for period boundaries (raise for monthly on low timeframes). |

| Per timeframe — Daily / Weekly / Monthly | What it does |
|---|---|
| **Enabled** | Turn the timeframe on or off. Default: Daily + Weekly on, Monthly off. |
| **Label prefix / Color** | The tag prefix (D / W / M) and the timeframe's colour. |
| **Show current (developing)** | Show the live period's running high/low. Off by default. |
| **Previous periods to show** | How many closed periods to mark. Default: 2 daily, 1 weekly. |
| **Current / Previous line style, width** | Dashed/dotted/solid styling for developing vs closed levels. |
| **Midline – show current** | Draw the 50% line for the developing period. |
| **Midline – previous count** | How many closed-period midlines (independent of the level count). 0 = none. |
| **Midline – color / style** | Colour and line style for the midline. |

# Ways to use it

| | |
|---|---|
| **Draw on liquidity** | Trade toward the obvious previous highs/lows (PDH/PDL, PWH/PWL). They're where stops rest, so price tends to reach for them. |
| **Sweep & reverse** | Watch a level get taken (swept) and reject — the dim/hide handling makes fresh sweeps easy to spot. |
| **Premium vs discount** | Use the midline as equilibrium: above = premium (look for sells), below = discount (look for buys). |
| **Keep it clean** | Defaults show 2 previous daily + 1 weekly with current off. Add monthly, more previous periods, or midlines whenever you want them. |

## Quick start

1. Add **HTF Levels by Orderflow Edge** from the indicator list.
2. Leave the defaults (2 previous daily + 1 weekly) or set your own counts.
3. Optional: turn on a midline (previous count = 1) for the equilibrium.
4. Pick dim or hide for swept levels, tune colours, and you're set.

**Trade toward liquidity, not into the unknown.**
