INDICATOR GUIDE

LTF Levels

Intraday liquidity, mapped. LTF Levels marks the **high and low of previous lower-timeframe periods** — H4, H1, M30, M15 — the resting liquidity that drives intraday moves.

The idea: lower-timeframe liquidity

The same liquidity story plays out intraday. Each closed H4/H1/M30/M15 period leaves a high and a low that later price reaches for and sweeps. LTF Levels keeps those levels — plus optional zones and equilibriums — in front of you, and fades them once they're taken.

Intraday levels

The draw

Previous H4 / H1 / M30 / M15 highs & lows — where intraday stops sit.

The sweep

The grab

Price trades one tick past a level = swept; it dims or hides.

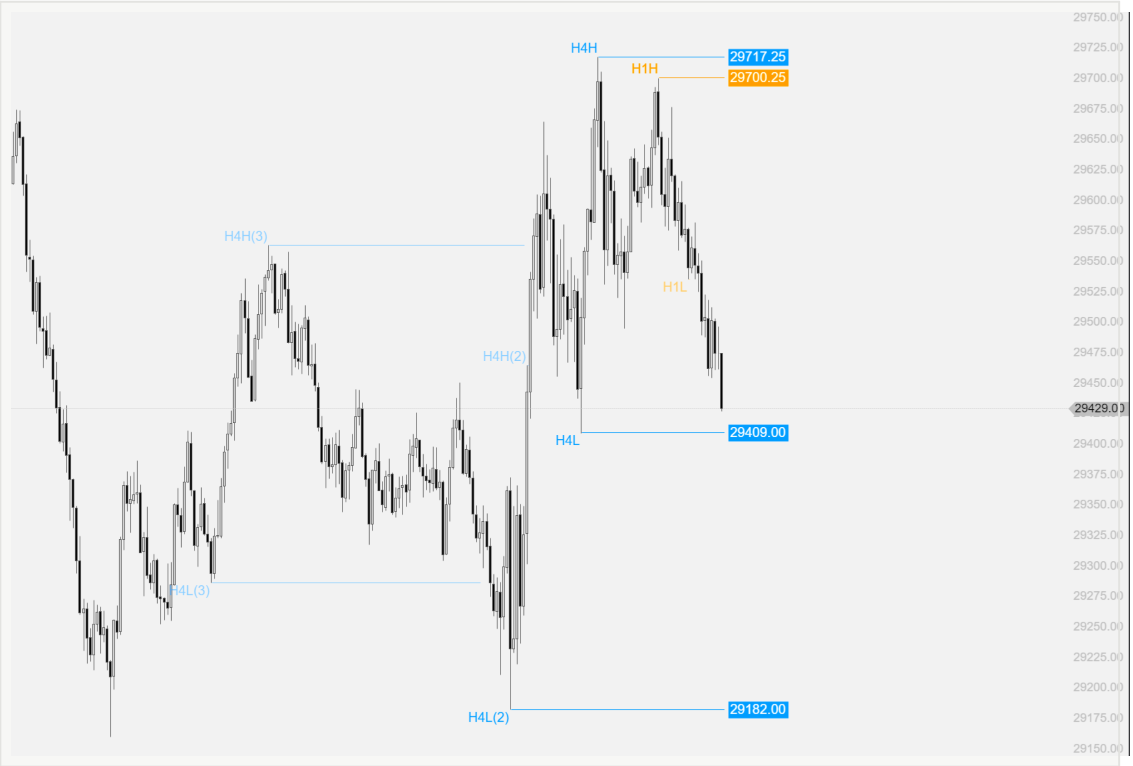
Zones & equilibrium

The context

Optional box per period and a 50% midline for fair value.

What it draws on your chart

Previous period lines	High & low of each closed period, per timeframe (H4/H1/M30/M15), labelled and colour-coded. Show as many previous periods as you like.
Boxes	Optional shaded box over each period's range (high to low).
Midline (equilibrium)	Optional 50% line per timeframe, with its own previous count — show many levels but few equilibriums.
Sweep handling	Taken levels dim (adjustable) or hide; the line freezes near the sweep.
Price tags	Exact price tags kept out to the right so they never block the level.
Smart labels	When levels sit close together, their labels stack instead of overlapping — the chart stays clean, never cluttered.
History warning	If the chart hasn't loaded enough bars for the periods you asked for, an on-chart notice tells you.



LTF Levels on a chart — H4 / H1 / M30 / M15 highs & lows, with optional range boxes.

Settings overview

Everything is optional and colour-adjustable. Here's what each group controls.

General	What it does
Unswept lines reach	Run unswept lines to the current bar or the price axis.
Sweep stop offset (bars)	Where a swept line freezes relative to the sweep bar.
Dim / Hide swept, brightness	Fade or remove taken levels; set how faint.
Show labels / position / font	Toggle labels, line start or end, set size.
Show price tags / unswept only / colour	Show the exact price tag, optionally only on untaken levels.
Box opacity (%)	Shading strength for the period boxes.
Max scan bars	Safety cap on history scanned for period boundaries.

Per timeframe — H4 / H1 / M30 / M15	What it does
Enabled	Turn the timeframe on or off. Default: H4 + H1 on, M30/M15 off.
Label prefix / Color	Tag prefix (H4/H1/…) and colour.
Previous periods to show	How many closed periods to mark. Default: 2 each.
Line style / width	Styling for the level lines.
Show box	Shade the period's range.
Midline – previous count	How many closed-period midlines (independent of the level count). 0 = none.
Midline – color / style	Colour and style for the midline.

Ways to use it

Intraday targets	Trade toward the obvious previous H1/H4 highs and lows — intraday draws on liquidity.
Sweep & reverse	Spot a level get taken and reject; the dim/hide handling makes fresh sweeps easy to read.
Zones with boxes	Use the boxes to frame intraday ranges and breakouts.
Equilibrium	Add a midline (previous count = 1) to judge premium vs discount inside a period.

Quick start

1. Add **LTF Levels by Orderflow Edge** from the indicator list.
2. Leave the defaults (2 previous H4 + H1) or set your own counts.
3. Optional: turn on boxes and a midline (previous count = 1).
4. Pick dim or hide for swept levels, tune colours, and you're set.
