INDICATOR GUIDE

Opening Levels

Where did the day open? The week? This hour? Opening Levels marks the **open price of every period** — Monthly, Weekly, Daily, and the lower timeframes most tools ignore (H4 / H1 / M30 / M15).

The idea: the open is a reference

A period's opening price is a natural line in the sand — above it the period is up, below it it's down. Traders lean on the daily and weekly open for bias, and the lower-timeframe opens are just as useful for intraday structure — but clean LTF opening levels are surprisingly hard to find. This draws them all.

Bias line

Above or below

The open splits the period into up vs down at a glance.

Intraday opens

The gap filled

H4 / H1 / M30 / M15 opens — the clean lower-timeframe lines most tools skip.

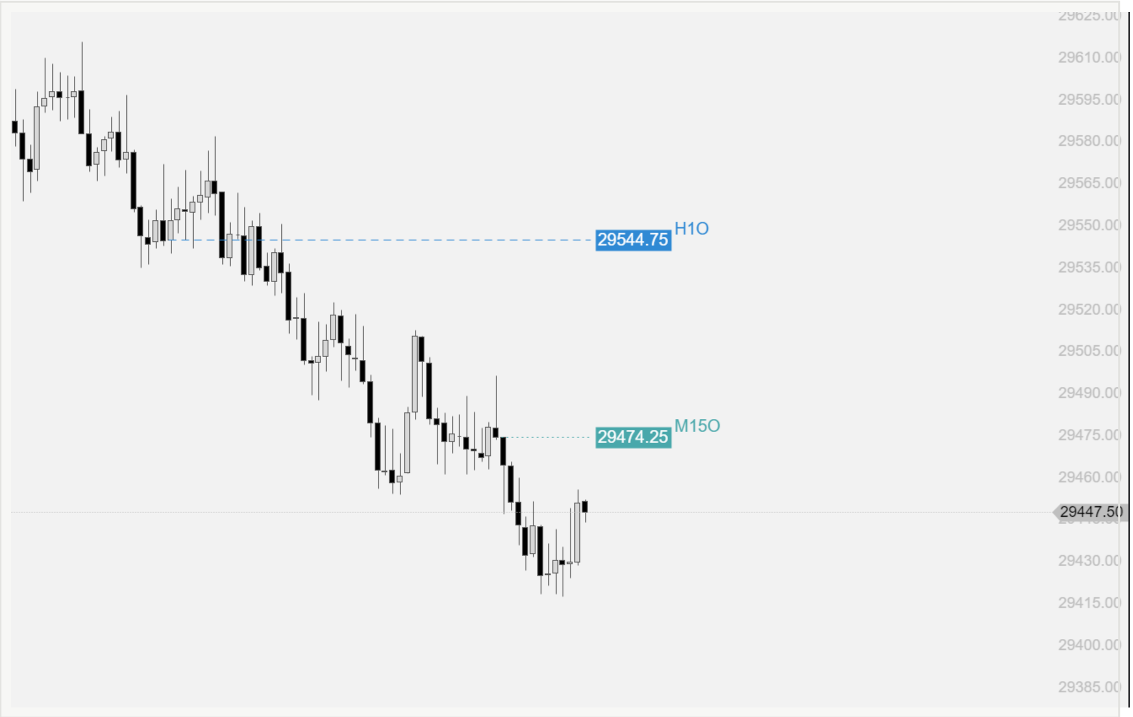
Stacked context

Multi-timeframe

Monthly down to 15-minute opens together for layered structure.

What it draws on your chart

Open lines per timeframe	M / W / D / H4 / H1 / M30 / M15 — each the period's first-candle open, labelled (DO, WO, H4O…) and colour-coded.
Current + previous	The current period's open extends to the live edge; previous opens span their own period (a stairstep of past opens).
Price tags & smart labels	Exact price tags at the line end and labels that stack instead of overlapping — kept clear of price.
History warning	If the chart hasn't loaded enough bars for a timeframe (e.g. monthly on a low TF), an on-chart notice tells you.



Opening Levels on a chart — period open prices (M / W / D / H4 / H1 / M30 / M15) as clean lines.

Settings overview

Everything is optional and colour-adjustable. Here's what each group controls.

General	What it does
Current line reaches	Run the current open to the current bar or the price axis.
Show labels / position / font	Toggle labels, line start or end, set size.
Show price tags / colour	Show the exact open price in a tag, set its text colour.
Max scan bars	Safety cap on history scanned for period boundaries.

Per timeframe — M / W / D / H4 / H1 / M30 / M15	What it does
Enabled	Turn the timeframe on or off. Default: Daily + Weekly on.
Label / Color	The line's label (e.g. DO) and colour.
Show current	Draw the developing period's open.
Previous count	How many previous opens to mark (0 = just the current).
Line style / width	Full / dashed / dotted and thickness.

Ways to use it

Daily & weekly bias	Trade with the period: above the daily/weekly open is bullish context, below is bearish.
Intraday structure	Use the H4/H1/M30/M15 opens as clean reference lines for entries and reactions — the part most tools miss.
Multi-timeframe confluence	Stack several opens; where they cluster is a stronger reference.
Keep it clean	Defaults show just the daily + weekly open. Add intraday opens or previous opens when you want them.

Quick start

1. Add **Opening Levels by Orderflow Edge** from the indicator list.
2. Leave the defaults (daily + weekly open) or enable the timeframes you trade.
3. Optional: turn on intraday opens (H1/H4) for lower-timeframe structure.
4. Tune colours and styles, and you're set.

Know where it opened.
