ORDERFLOW EDGE

INDICATOR GUIDE

PO3 - Power of Three

See the higher-timeframe story unfold on your execution chart. PO3 draws the **current developing higher-timeframe candle** as a clean box beside live price, and projects its open, high, low and midpoint across your chart - so you always know where the big candle is building from.

The idea: Power of Three

Every higher-timeframe candle tends to build in three acts. Price first **accumulates** in a range, then **manipulates** by running the obvious highs or lows, and finally **distributes** in the real direction. PO3 shows that candle forming in real time, so the model is right there while you trade.

1 . Accumulation

Build the range

Price coils near the open. The high and low of the candle set the field of play.

2 . Manipulation

Run the stops

A push past one side traps traders and grabs liquidity before the real move.

3 . Distribution

Make the move

Price expands the other way toward the close - the candle's true intent.

The high-timeframe candle is the developing one - open is fixed, high/low run live, close updates with price. Up or down colour follows close vs open.

What it draws on your chart

The HTF candle box	The developing higher-timeframe candle, drawn to the right of live price with body, border and wick. Pin it to the price axis so it stays put when you zoom, or anchor it to the last candle.
Open projection	A line from the candle's open across the chart - the level the whole period is building from.
High / Low projections	The running high and low of the developing candle, projected as lines. These are the levels that get run during manipulation.
Midpoint (CE)	The candle's equilibrium (50%) - a natural magnet and a clean line between premium and discount.
Close line	The live close, optional. Off by default so it doesn't double up with your chart's own price tag.
Labels	O / H / L (and optional C) price tags, plus a timeframe label like “1D” so you always know which candle you're looking at.
Info table	An optional corner readout: timeframe, range in price and ticks, and body size.

PO3 on a chart — the developing higher-timeframe candle and its projected open / high / low.

Settings overview

Everything is optional and colour-adjustable. Here's what each group controls.

PO3	What it does
Higher timeframe	Which candle to draw: 1h, 2h, 3h, 4h, 6h, 8h, 12h, 1 day, 1 week or 1 month.
Box anchor	Pin the box to the price axis (stays fixed when you zoom) or to the last candle.
Offset (px)	How far right of live price the box sits.
Candle width (px)	Width of the drawn HTF candle box.
Show behind chart	Render the box behind your candlesticks for a cleaner look.
Use custom opening hour	Anchor the candle to an hour you choose instead of the session open. Works on the 1-day and intraday blocks.
Opening hour (chart time)	The hour (0-23) where the candle starts - e.g. set it to whatever NY midnight reads as on your chart.

Candle	What it does
Body - up / down	Fill colour for bullish vs bearish developing candles.
Border - up / down	Outline colour, up vs down.
Wick - up / down	Wick colour, up vs down.

Projections (each line: show / colour / width / style)	What it does
Open line	Show/style the open projection. Each line starts at the exact candle that made the level and runs to the box.
High / Low lines	Show/style the running high and low projections.
Close line	Show/style the live close projection.
Midpoint (CE)	Show/style the equilibrium (50%) line.

Labels	What it does
Show OHLC labels	Master toggle for the O / H / L price tags.
Show Close (C) label	Adds the C tag. Off by default - it sits on the live price and clutters the chart's own tag.
Label text colour / Font size	Colour and size of the price labels.
Timeframe label	Show, colour and size of the “1D / 4H / ...” tag above the box.

Info table	What it does
Show info table	Toggle the corner readout (timeframe, range, body size).
Table corner	Top-left, top-right, bottom-left or bottom-right.
Table text / background	Colours for the readout.

Ways to use it

NY-midnight daily open	Set Higher timeframe to **1 day**, turn on **Use custom opening hour**, and set the hour to whatever NY midnight (00:00 ET) reads as on your chart. The daily candle now opens at midnight - a classic reference for the day's bias.
Session-open default	Leave the custom hour off and the candle opens at the instrument's session open - matching native session tools.
Custom intraday blocks	On a 4h / 1h timeframe, the custom opening hour also anchors those blocks - handy if you frame intraday around a specific hour.
Clean execution view	Turn on **Show behind chart** and hide the close label so the box and levels sit quietly behind your candles while you trade.

Quick start

1. Add **PO3 - Power of Three by Orderflow Edge** from the indicator list.
2. Pick your higher timeframe (start with 1 day).
3. Optional: turn on the custom opening hour for the NY-midnight open.
4. Tune colours to your chart and you're set.

Trade the candle, not the guess.
